METAMASK EXTENSIONS

MetaMask is a browser extension that allows users to access Ethereum-enabled distributed applications, or "Dapps," in their browser. The extension injects the Ethereum web3 API into every website's JavaScript context, enabling users to interact with Ethereum-based applications directly from their browser. MetaMask also helps warn users when they navigate to sites that are known to have engaged in phishing or that have names that are suspiciously similar to popular phishing targets. To use MetaMask, users need to install the extension in their browser of choice on their development machine.
